14
15 P R O C E E D I N G S

16
17 COURT SECURITY OFFICER: All rise for the
18 jury.

19 (Jury in.)

20 COURT SECURITY OFFICER: Thank you. You
21 can be seated.

22 All rise.

23 THE COURT: Please be seated.

24 Appreciate your patience. We took a
25 little longer with Judge Everingham's selection than we

1 expected, but let me give you a second very brief
2 summary of what we should expect over the next hour and
3 a half, hour and 45 minutes.

4 Very shortly, I'm going to give you some
5 preliminary jury instructions that will help guide your
6 deliberations in this case or carry out your duties as
7 members of the jury.

8 After that, then I'm going to give each
9 side up to 45 minutes to give an opening statement.

10 Then we're going to break for the day,
11 because that will take us to about 3:30 or 3:45. And I
12 have some work to do with the lawyers.

13 What -- if we started the first witness,
14 it's going to last more than an hour or hour and a half,
15 and I don't think we want to go to 5:00 o'clock
16 probably. It's Friday. We will start slowly into this
17 process.

18 Now, you have notepads. You're welcome
19 to take notes, and I will give you some instructions
20 about the use of those notes.

21 Are the parties going to pass out the
22 jury notebook today, or are you going to wait until
23 Monday?

24 MR. BECK: Your Honor, maybe we ought to
25 wait till Monday, if that's okay with the Court.

1 THE COURT: You will have a jury notebook
2 Monday, and we will put a copy of the preliminary charge
3 in the jury notebook for your use.

4 So with those comments, I'll give the
5 Court's initial or preliminary jury instructions.

6 Members of the jury: Now that you have
7 been sworn, I will give you some preliminary
8 instructions to guide you in your participation in the
9 trial. It will be your duty to find from the evidence
10 what the facts are. You and you alone will be the
11 judges of the facts.

12 This goes with this concept that I
13 mentioned during jury selection that there are two
14 judges in every jury case; the jury being the judges of
15 the fact -- facts.

16 You will then have to apply those to
17 facts the law as the Court -- the law as the Court will
18 give to you. As I've stated earlier, you must follow
19 that law whether you agree with it or not.

20 Nothing the Court may say or do during
21 the course of the trial is intended to indicate or
22 should be taken by you as indicating what your verdict
23 should be.

24 As I said, you will arrive at your
25 verdict -- or the evidence will consist of the facts

1 that you have from the testimony of witnesses,
2 documents, and other things received into the record as
3 exhibits and any facts that the lawyers agree to or
4 stipulate to or that the Court may instruct you to find.

5 Now, there are certain things that are
6 not evidence and must not be considered by you. I will
7 list them now.

8 1. Statements, arguments and questions by
9 lawyers are not evidence.

10 2. Objections to questions. Lawyers have
11 an obligation to their clients to make objections when
12 they believe that the evidence being offered is improper
13 under our rules. You should not be influenced by the
14 objection or by the Court's ruling on it.

15 If the objection is sustained, ignore the
16 question; if it is overruled, treat the answer like any
17 other. If you are instructed that some item of evidence
18 is received for a limited purpose only, you must follow
19 that instruction.

20 Testimony that the Court has excluded or
21 told you to disregard is not evidence and must not be
22 considered.

23 4. Anything you may have seen or heard
24 outside the courtroom is not evidence and must be
25 disregarded. You are to decide the case solely on the

1 evidence presented here in the courtroom.

2 Now, there are two kinds of evidence:
3 Direct and circumstantial.

4 Direct evidence is direct proof of a
5 fact, such as testimony of an eyewitness.

6 Circumstantial evidence is proof of facts
7 from which you may infer or conclude that other facts
8 exist.

9 I will give you further instructions on
10 these as well as other matters at the conclusion of the
11 case, but keep in mind that you may consider both kinds.

12 It will be up to you to decide which
13 witness to believe, which witness not to believe, and
14 how much of any witness' testimony to accept or reject.

15 I will give you some more detailed
16 guidelines for determining the credibility of witnesses
17 at the conclusion of the case.

18 Now, you heard the lawyers talk today
19 about burden of proof, and we have two different burdens
20 in this case.

21 Preponderance of the evidence. When a
22 party has the burden of proof on any claim or
23 affirmative defense by a preponderance of the evidence,
24 it means you must be persuaded by the evidence that the
25 claim or affirmative defense is more probably true than

1 not true. You should base your decision on all the
2 evidence regardless of which party presented it.

3 Now, you heard the concept, clear and
4 convincing evidence. When a party has the burden of
5 proving any claim or defense by clear and convincing
6 evidence, it means you must have an abiding conviction
7 that the truth of the parties' factual contentions are
8 highly probable.

9 Such evidence requires a higher standard
10 of proof than proof by a preponderance of the evidence.

11 Again, you should base your decision on
12 all the evidence regardless of which party presented it.

13 In this case, you'll hear from expert
14 witnesses. When knowledge of a technical subject matter
15 may be helpful to the jury, a person who has special
16 training or experience in that technical field, called
17 an expert witness, is permitted to state his or her
18 opinion on these technical matters. However, you are
19 not required to accept that opinion. As with any other
20 witness, it is up to you to decide whether to rely upon
21 it or not.

22 Depositions. During the course of this
23 case, certain testimony may be read to you by way of
24 deposition, or you may also see it by way of video. The
25 testimony of a witness, who for some reason could not be

1 present to testify from the witness stand, is usually
2 presented in writing under oath in the form of a
3 deposition or by video deposition.

4 Such testimony is entitled to the same
5 consideration and so far as possible is to be judged as
6 to credibility and weight and otherwise considered by
7 the jury in the same way as if the witness had been
8 present and had given from the witness stand the
9 testimony read to you from the deposition.

10 Now I'm going to talk about the parties
11 involved in this case, and then I'll give you a brief
12 summary of their contentions.

13 The Plaintiffs -- and as you recall the
14 Plaintiff is the party that brings the suit -- the
15 Plaintiffs in this case are Retractable Technologies,
16 Inc., which may be referred to as RTI or Retractable,
17 and Mr. Thomas J. Shaw.

18 The Defendant in this case is Becton
19 Dickinson and Company, which may be referred to as BD.

20 This is a patent case in which
21 Retractable and Mr. Shaw seek damages for BD's alleged
22 infringement of United States Patents No. 5,632,733;
23 6,090,077; and 7,351,224.

24 You will be happy to hear that these
25 patents will simply be referred to as the '773 (sic)

1 patent and the '077 patent and the '224 patent,
2 respectively.

3 The '77 -- excuse me -- the '733 patent
4 is entitled Tamper-Proof Retractable Syringe. The '077
5 patent is entitled Syringe Plunger Assembly and Barrel.
6 The '224 patent is entitled Retractable Syringe Assembly
7 Design for One Use.

8 Retractable and Mr. Shaw further allege
9 that the infringement has been willful. BD denies
10 infringements and seeks declaratory judgments of
11 non-infringement invalidity and unenforceability.

12 At the conclusion of the trial, when I
13 give you your final instructions, I will explain the
14 appropriate burden to apply to each of the claims and
15 defenses brought by the parties.

16 I will now explain generally the U.S.
17 patent system, the parts of a patent, and how a person
18 receives a patent.

19 You've probably seen some of this on the
20 video today, but I think it is worthy of being repeated.

21 The United States Constitution grants
22 Congress the powers to enact laws to promote the
23 progress of science and useful arts by securing for
24 limited times to authors and inventors the exclusive
25 right to their respective writings and discoveries.

1 Under this power, Congress enacted the
2 patent laws. Patents are granted by the United States
3 Patent & Trademark Office, which is oftentimes referred
4 to as the PTO.

5 A valid United States patent gives the
6 patent holder certain rights. The patent holder may
7 prevent others from making, using, offering to sell, or
8 selling the patented invention within the United States
9 or from importing it into the United States without the
10 patent holder's permission.

11 A violation of the patent holder's rights
12 is called infringement. The patent holder may try to
13 enforce the patent against persons believed to be
14 infringers by a lawsuit filed in federal court.

15 The process of obtaining a patent is
16 called patent prosecution. To obtain a patent, one must
17 file an application with the PTO. The PTO is an agency
18 of the federal government and employs trained examiners
19 who review applications for patents.

20 The application includes a section called
21 the specification, which must contain a written
22 description of the claimed invention, telling what the
23 invention is, how it works, and how to make it and use
24 it in such full, clear, concise, and exact terms so that
25 others skilled in the field will know how to make and

1 use it.

2 The specification concludes with one or
3 more numbered sentences. These are the patent claims.

4 If the patent is eventually granted by
5 the PTO, the claims define the boundaries of its
6 protection and gives notice to the public of those
7 boundaries.

8 Claims can be independent or dependent.
9 An independent claim is self-contained. A dependent
10 claim refers back to an earlier claim and includes the
11 requirements of the earlier claim.

12 After the applicant files a patent
13 application, a PTO Patent Examiner reviews it to
14 determine whether the claims are patentable and whether
15 the specification adequately describes the invention
16 claimed.

17 In examining a patent application, the
18 Patent Examiner may review prior art. Prior art is
19 defined by law. And at a later time, I will give you
20 more detailed instructions on what constitutes prior
21 art.

22 In general, though, prior art includes
23 things that existed before the claimed invention that
24 were publicly known or used in this country or that
25 was -- that were patented or described in a publication

1 in any country.

2 The Examiner considers, among other
3 things, whether such claim defines an invention that is
4 new, useful, and not obvious when compared with the
5 prior art.

6 A patent lists the prior art the Examiner
7 considered. This list is called the cited references.
8 The cited references include the prior art found by the
9 Examiner as well as any prior art submitted to the PTO
10 by the applicant.

11 After the prior art search and
12 examination of the application, the Patent Examiner then
13 informs the applicant in writing what the Examiner has
14 found and whether any claim is patentable and thus will
15 be allowed.

16 This writing from the Patent Examiner is
17 called an office action. If the Examiner rejects any of
18 the claims, the applicant then responds and sometimes
19 changes the claims or submits new claims.

20 This process, which takes place only
21 between the Examiner and the patent applicant, may go
22 back and forth for some time until the Examiner believes
23 that the application and claims meet the requirements
24 for a patent.

25 The papers generated during this time of

1 communicating back and forth between the Patent Examiner
2 and the applicant make up what is called the prosecution
3 history. All this material becomes available to the
4 public no later than the date when the PTO grants the
5 patent.

6 Just because the PTO grants a patent does
7 not necessarily mean that any invention claimed in the
8 patent is, in fact, legally entitled to protection of
9 the patent. One or more claims may, in fact, may not be
10 patentable under the law.

11 The person accused of infringement has
12 the right to argue here in federal court that a claimed
13 invention in the patent is not entitled to patent
14 protection because it does not meet the requirement for
15 a patent.

16 In other words, an accused infringer may
17 defend a suit for patent infringement on the grounds
18 that the patent is invalid. Nevertheless, patents
19 issued by the United -- excuse me -- United States
20 Patent Office are presumed to be valid, and the accused
21 infringer has the burden of showing invalidity.

22 I will later instruct you in more detail
23 on the burden of showing invalidity, but note that the
24 validity of the patent-in-suit will be disputed, and it
25 is ultimately your job to determine whether or not the

1 patent is valid or invalid.

2 Now, a few words, generally, about your
3 conduct as members of this jury.

4 First, I instruct you that during the
5 trial you are not to discuss the case with anyone or
6 permit anyone to discuss it with you. Until you retire
7 to the jury room at the conclusion of the case to
8 deliberate on your verdict, you simply are not to talk
9 about this case.

10 You are to hold yourself completely apart
11 from the people involved in the case, the parties, the
12 witnesses, and the attorneys -- the attorneys and
13 persons associated with them.

14 This also means that if you have a
15 social, as I told you earlier, networking internet site
16 or like Facebook, MySpace, or others, you should not
17 discuss or even mention the case at all on these sites.

18 Do not receive or post updates about what
19 is going on in this case. And as I told you earlier,
20 make no efforts to investigate on the internet or
21 otherwise of any of the subject -- any subject matter
22 involving this case.

23 Second, do not read or listen to anything
24 touching on this case in any way. If anyone should try
25 to talk to you about it, bring it to the Court's

1 attention promptly.

2 As I've said, do not do any research or
3 make any investigation about the case on your own.

4 Finally, do not form any opinion until
5 all the evidence is in. Keep an open mind until you
6 start your deliberations at the conclusion of the case.

7 If you wish, you may take notes, but if
8 you do, leave them in the jury room when you leave at
9 night. And remember, they are for your own personal
10 use.

11 Please keep in mind that oftentimes I'll
12 have a jury request a copy of the transcript. Even
13 though the court reporter is taking down the testimony,
14 that's often not available for days and weeks after the
15 trial is complete. So it's going to be impossible to
16 give you a copy of the transcript. You are going to
17 need to rely on your notes and memory during the
18 deliberations and the exhibits that you may request.

19 Very shortly, the trial will start.
20 First, each side may make an opening statement. An
21 opening statement is neither evidence nor argument. It
22 is an outline of what that party intends to prove in
23 order to help you follow the evidence.

24 Next, the Plaintiff will present its
25 witnesses, and the Defendant may cross-examine them.

1 and little and all that kind of thing.

2 But it really brings to mind, this case
3 does, the real story of David and Goliath. And that is
4 how a little guy with better technology -- with better
5 technology can beat the big guy. That's what this case
6 is about.

7 Because what you're going to find is that
8 our company, RTI, the company up in Denton County, came
9 up with not a solution, not one solution but the only
10 solution and the best solution for this terrible problem
11 of needlesticks.

12 And what you're going to find in the
13 evidence is just like 2000 years ago, we still had
14 Philistines coming from the north with pointed objects
15 trying to stick people, and that's what we're trying to
16 prevent.

17 Now, let me start this way, if the Court
18 please.

19 This, you remember, I talked to you a
20 little bit when you were being questioned about what I
21 call a shot needle. And we've all seen them, and we're
22 all terrified of them.

23 But really and truly, they don't look
24 that complicated, do they? You've got a plunger up at
25 the top, and that kind of makes sense. That's what you

1 push to push the medicine out.

2 You've got a barrel. Can everybody see
3 this? You've got a barrel that the medicine is in.

4 These two little devices are called
5 flanges. Flanges. And that's so you can fit your
6 middle and index finger in front of them and get a
7 purchase on the syringe when you push the plunger to
8 give the shot.

9 So the idea is the nurse takes the cap
10 off, and that's the sterile needle, and he or she fills
11 the barrel up with whatever material is going to be
12 injected, and then that shot is ready to go.

13 But -- and this is a very important
14 but -- this needle is still sterile. It's still
15 sterile.

16 And what happens afterward -- and you-all
17 kind of walked through this thing with me before
18 lunch -- is the nurse, as a person, somebody like you or
19 me -- and the nurse has that syringe with that needle,
20 and that nurse has a person who's probably scared, and
21 that nurse has to, as gently as he or she can, give that
22 shot.

23 Now, once that shot needle -- this needle
24 goes into that person's arm or leg or hip, it is
25 contaminated, just by definition.

1 And then walk through this with me,
2 because we've all had it done to us, and we've all seen
3 it done a gillion times.

4 What happens next? The nurse has to do
5 what?

6 He or she has to take the needle out, and
7 with a conventional shot needle, that needle, that
8 contaminated needle is exposed.

9 And so until the good Lord gives us
10 nurses with three hands, what has to happen?

11 The nurse either has to say:
12 Mr. Patient, I'm not going to worry about your bleeding
13 arm right now. You sit there and bleed, and I'm going
14 to do something to make this contaminated needle safe.
15 Or what we all know is more likely, is because the nurse
16 is there to treat the patients, the nurse is going to
17 put that contaminated needle down, and then the nurse is
18 going to deal with this patient.

19 And then there sets the contaminated
20 needle that might have HIV on it or might have Hepatitis
21 C on it or might have any other kind of problem on it.
22 And it's there waiting to stick somebody else.

23 That's the hazard. That's the hazard.

24 And our solution -- and Mr. Shaw, sitting
25 right here at the end of the table, is the fellow who

1 first made the retractable -- automatic retractable
2 technology work.

3 I'll say that again. Mr. Shaw, the man
4 at the end of the table, is the first inventor to come
5 up with an automatic retractable technology that worked.
6 Other people had the idea, but his was the first to
7 work. And he convinced the Patent Office that it would
8 work and that it was new, that nobody had done it that
9 way before. And he applied for it and got a patent.

10 And here's what his patent did. Go back
11 to my example.

12 Here I am a nurse, and I have my shot
13 needle, and I pull off my cap. There it is; there's the
14 old needle as scary as it looks. And I fill up my
15 barrel. Remember my barrel?

16 I fill it up with my medicine -- whoop,
17 not that much -- and I'm ready to go. And here's my
18 patient, my Otis Carroll, who doesn't want to be here.
19 And I tell him to be calm; I'm not going to hurt him.
20 And I give him the shot, and I push that plunger all the
21 way down, and it retracts into the barrel of the
22 needle -- I mean, into the barrel of the syringe.

23 So what has happened? What has
24 Mr. Shaw's invention done?

25 It has made up for the lack of the

1 three-handed nurse, because right now, when it's used
2 properly, that contaminated needle never comes out of
3 Otis Carroll's arm and that is a big deal. That is a
4 big deal, a deal that's so big you'll hear testimony
5 from Mr. Shaw that it took him ten years to perfect.
6 Ten years, one decade working as hard as he could.

7 Because one word that you will hear used
8 to describe this -- and it looks pretty darn simple,
9 right? But one word you'll hear to describe the
10 finished convention is elegant. Elegant.

11 Sometimes people talk about elegant
12 statuaries or elegant paintings or elegant works of art.
13 Well, inventions can be elegant. They can be so simple
14 that they're beautiful. That's how this invention is
15 described.

16 So here we are, a little company in
17 Denton County, Texas, and we have this elegant patented
18 solution.

19 And by the way, this is all we do:
20 Automatic retractable, non-reusable syringes, which
21 means that we never have a syringe that can be left on a
22 table or left on a beach or put in a garbage sack that
23 could stick somebody. That's not our idea of a safe
24 product.

25 One big issue in this case you're going

1 to hear, and BD staked out this ground, and that is
2 they're all about choice. They want to give the
3 consumers, the users, the nurses choice.

4 We don't think there is a choice. They
5 have a lot of products that we say aren't safe, but they
6 sell them as safe. So watch for that. Watch for that
7 during the trial, because this is about the idea of
8 retractable automatic technology.

9 Let me tell you what you're going to hear
10 in the next few minutes, because it's not all going to
11 be from me.

12 Mr. Hardin over here, who's an engineer
13 and a lawyer, is going to talk to you about that elegant
14 technology, and he's going to talk to you about why we
15 say and we believe we're right, that our friends over
16 here have trespassed on that technology.

17 Let's put up the first Farmer Brown
18 picture.

19 Here we go. This is my cartoon, and you
20 see the posted no trespassing?

21 That's what the patent law gives Tom Shaw
22 and RTI for his patented technology: Posted, no
23 trespassing. Don't use my -- don't use my property
24 unless I give you the permission, the right, to do that.

25 We say that in about the year 2000 -- and

1 that's an important date -- that our friends over here
2 at BD came into our fence line, posted, and that they
3 trespassed.

4 And here's why we say they do. We say
5 that they, along with us and everybody else in this
6 industry, knew that the law was about to change and that
7 the government was about to make this industry go to
8 this technology: Automatic retractable, non-reusable.
9 We had it; they didn't. And we say that's when the
10 infringement occurred.

11 Now, they'll tell you that the
12 infringement wasn't infringement at all; it was just
13 their opportunity to do something a little bit different
14 or maybe a big bit different. And they'll talk to you
15 about what they did to make it different.

16 But you're going to be the judge, and
17 you're going to see the proof that they didn't make it
18 different, that they tried to make it look different so
19 it wouldn't be obvious that they had copied us. But in
20 the end, that's what they did.

21 So what we're going to be asking you to
22 do, when it comes time, is to address whether, in fact,
23 they trespassed. And Mr. Hardin will talk to you about
24 that. And then Mr. Bowles will talk to you about the
25 damage.

1 And I'm going to tell you two things and
2 then I will be done.

3 | Let's go to Farmer Brown 2.

4 And you heard me talk a little bit about
5 this to your colleagues on the voir dire, on the jury
6 pick we had before lunch.

7 The law requires us to time travel; that
8 is, we go back to 2000, when we said they trespassed on
9 our property. And we have to decide -- you have to
10 decide what would have happened if our friends, BD, had
11 played nice and before they trespassed, come to us and
12 said: Look, RTI, look, Tom Shaw, we know you've got a
13 valid patent, and we know we're about to infringe it and
14 we need it. Let's make a deal. Let's make a deal.

15 And we say -- and you're going to hear
16 from a person who's done those same kind of
17 negotiations, a CPA named Walt Bratic.

18 We say that that negotiation would have
19 been for a lump-sum royalty, just like an oil royalty
20 where you get so many percent of whatever is produced.
21 But -- this is a very important but -- we say that the
22 but would have been that RTI would not have counted on
23 BD to sell retractable technology, because they had a
24 lot of other stuff to sell that was not safe, we say.

25 Just like in our little picture here, if

1 Farmer Brown is trying to decide what kind of a deal to
2 make from the oil company when they're drilling on his
3 property, and he knows, under the hypothetical
4 negotiation because their cards are up on the table,
5 that they've got competing wells all around his place,
6 he might think to himself: How do I know they will pump
7 my well? How do I know they will pump my well?

8 So maybe what I ought to do is make them
9 tell me, because they've got to -- they've got to shell
10 their corn down and tell me what they know -- tell me
11 how much is down there and what they think they can get.
12 And I'll just make a deal with them for a flat fee
13 upfront, and I won't have to worry about that.

14 So that's what Mr. Bowles is going to
15 talk to you about.

16 The first witness you're going to hear
17 Monday, and it's going to be my privilege to introduce
18 you to her, is Ms. Duesman right here. You met her this
19 morning. Kathryn Duesman.

20 You're going to hear from her. She's a
21 nurse; she's a rancher, she and her husband. And you're
22 going to hear how she joined the company. And it's a
23 wonderful story, and it gave her an opportunity to go to
24 a company and sell and help develop a product that she
25 believes in will save lives.

1 And you're going to find out that the
2 company she joined nurtures inventions. She's an
3 inventor herself. So that's what you're going to hear
4 in the next few minutes.

5 And next week, we're going to explain to
6 you from evidence from that chair why, number one, they
7 infringe; number two, it was willful; and Judge Folsom
8 will explain that to you; and, number three, that they
9 owe us damages in the form of this paid-up royalty.

10 And their defense, of course, is we
11 didn't do it, but if we did do it, your patent's no
12 good. But if your patent's good, we don't owe you much
13 money. That's going to be their defense.

14 And so that's what you will be faced
15 with.

16 And we look forward to putting on the
17 case. And with the Court's permission, I'm going to
18 turn the podium over to Mr. Hardin.

19 MR. HARDIN: Thank you, Mr. Carroll.

20 May it please the Court.

21 Ladies and Gentlemen, it is my distinct
22 honor to talk to you about Mr. Shaw's inventions. I am
23 a patent lawyer. That means I write patents and go to
24 the Patent Office and argue for inventors. And I have
25 had the privilege of doing that with Mr. Shaw for a long

1 time.

2 These are the fruits of his work. These
3 are the United States patents. They are essentially
4 deeds to his intellectual property.

5 We're going to talk about three of them.
6 I only have a few minutes, so I'm going to be kind of
7 quick with them, but I want to give you an overview
8 about what each of them is about.

9 And I should mention, as the Court said,
10 that the Patent Office looked at these and cited what we
11 call prior art on the front. It's a list.

12 May I have that slide, please?

13 Here we go. So I'm going to tell you
14 right now, Mr. Shaw didn't -- wasn't the first to have
15 the idea of the retractable syringe. He wasn't the
16 first to design the retractable syringe. He wasn't the
17 first patent of the retractable syringe.

18 I looked up on the internet the other
19 day, however, and you know what? There were about 12 or
20 14 fellows that said they invented a flying machine
21 before the Wright brothers.

22 The problem was, none of those machines
23 got off the ground.

24 Mr. Shaw was the first to make a design
25 to actually work. There's not going to be any evidence

1 to the contrary. His designs actually worked.

2 So he didn't invent the concept. He
3 wasn't the first to patent just an idea, but he was the
4 first to make a product that actually can help save
5 lives.

6 Now, how hard was that? If we had all
7 these people with designs and there were all these
8 patents out there, how hard could it be to make one
9 work?

10 Well, the proof of that comes right from
11 the mouths of engineers at Becton Dickinson. I want to
12 take you back to 1995. Mr. Shaw had been working on the
13 problem for six or eight years.

14 Becton Dickinson knew about all these
15 patents that had issued. Becton Dickinson is a big
16 company. They get a lot of submissions from folks.
17 Their engineers are bright people. They all had thought
18 about the general concept of a retractable syringe.

19 But they concluded something about the
20 general idea, and so they published a brochure in 1995
21 to their sales folks, because, essentially, they said,
22 you know what? We've looked at this idea. The problem
23 is, it can't be done. We can't make it work.

24 And so we shouldn't get people excited
25 about the idea that the needle would just disappear back

1 up into the syringe, because it's not going to happen.

2 Let's look at that document. This is
3 from Becton Dickinson files, written by some technical
4 folks.

5 It is called Rethink Retractable. It
6 was issued in May 3, 1995. Becton Dickinson engineers
7 worked very hard trying to make this idea work for us,
8 but we could never get a retractable needle syringe to
9 perform to the standards we feel necessary to meet our
10 customers' legitimate needs and expectations. And they
11 continue.

12 I have a vivid memory of the week that
13 the CDC changed its mind about AIDS. Early in the
14 course of the epidemic, they assured physicians and
15 nurses that we had nothing to fear. And then one
16 morning, the message changed.

17 Within three days, a physician with whom
18 I worked at the time presented us his solution to the
19 needlestick injury problem: A retractable needle
20 syringe. He lacked the ability to actually design such
21 a product, but the basic idea jumps quickly into the
22 mind of any inventor who thinks about this problem.

23 So it's one of those things when we think
24 about it, oh, yeah, that's a great idea. But in 1995,
25 Becton Dickinson was essentially saying, look, we looked

1 at this; we can't get it done. Let's tell -- let's tell
2 our sales staff that so people don't get excited.

3 What they probably didn't know at the
4 time, although Mr. Shaw had sent them some early ideas,
5 like a lot of inventors, was that Mr. Shaw had been
6 working day in and day out every night, every day --
7 you'll hear this from him -- for six or eight years by
8 the time this 1995 date comes around.

9 And just a week after Becton Dickinson
10 engineers made this statement about, well, it can't be
11 done, Mr. Shaw went to the Patent Office and filed the
12 first of a series of patents that would end up, through
13 appropriate patent procedures, in the three patents we
14 have hear.

15 Can you see that slide?

16 This is three days -- the BD brochure was
17 on May 3, 1995. On May 11th, Mr. Shaw asked the Patent
18 Office for these patents, which were eventually issued.
19 And he told them that this invention related to a
20 medical device, and more particularly, a retractable
21 syringe suitable for mass production and assembly,
22 having a low triggering force -- that's something we're
23 going to talk about in a minute -- and a high blowout
24 pressure, which is non-reusable after one use.

25 These patents issued as a result.

1 Now, fastforward from 1995 to two years
2 later. It took that long for Mr. Shaw to put in place
3 what he needed to get the product into the marketplace.
4 And as Mr. Carroll has shown you, this product entered
5 the marketplace two years later in about 1997, with
6 Becton Dickinson having said, of course, it can't be
7 done.

8 We'll deal with this a lot in the trial,
9 but take a look. I want to make sure everybody can see.
10 It's kind of hard to see, but here's the needle right
11 here at the end of my finger.

12 And after this injection is delivered,
13 the nurse simply presses a little harder, and two things
14 happen. The needle jumps back into the barrel, and the
15 other thing is this end cap, this plunger cap, cuts down
16 to this collar.

17 Why is that important?

18 Well, because she can't easily dig it
19 out. Kind of tied the container for us, doesn't it?
20 We've got it all nice and contained. No one can get
21 hurt. She can throw it out.

22 If this wasn't down inside this collar,
23 it's possible she just might -- somebody might, without
24 thinking, dig it out and drop it.

25 So that was an important invention, and

1 the patents-in-suit cover those features.

2 What was happening at BD?

3 Well, in 1997, BD had seen Mr. Shaw's
4 product. And Mr. Shaw was anxious to try to get his
5 product to market, so they said, sure, we'll take a look
6 at it. So he sent them some syringes in 1997.

7 On July 22nd, 1997, they asked for some.
8 Mr. Jon Bell was an engineer of BD. Mr. Jon Bell asked
9 Mr. Shaw to send some syringes.

10 Great, let's send them all.

11 What Mr. Shaw didn't know was that BD had
12 basically panicked in 1997, because he had made
13 something that flies. He had made one of these things
14 they said couldn't be made.

15 What he didn't know was, on the same day
16 he was sending them some product to look at, another
17 person at Becton Dickinson on July 22nd, 1997 was
18 publishing a brochure -- getting a brochure ready to go
19 out to their sales force with all the reasons not to buy
20 this VanishPoint product.

21 Don't buy it. It's got all sorts of
22 problems. Don't even look at it. If you're asked to
23 look at it -- she has a list of potential negatives.
24 Eventually, of course, what happened was is Becton
25 Dickinson turned around. Within a couple of years of

1 that 1997 date, they understood they had to have this
2 product, and they had to have it badly.

3 So they went out and bought a company,
4 and I'll come back to that, because that's one of their
5 main defenses. But before I go there, I want to kind of
6 race through with you the basic technology that Mr. Shaw
7 invented. And I'm going to do it in a fashion that
8 really doesn't do it justice, because I have such a
9 short period of time.

10 So I want to talk to you first about the
11 '224 patent. The '224 patent is really about how this
12 syringe operates, how it works.

13 One of the key pieces of this product is
14 a little tiny piece in the barrel. It's up here in the
15 nose, a little tiny ring. The needle holder -- the
16 needle sticks into the piece of plastic. That piece of
17 plastic has another ring around it.

18 And then this plunger moves down to the
19 end of the plunger, hits that ring and knocks it off.
20 That's the way it works.

21 Mr. Shaw thought of two different ways to
22 do that. He thought: I could have the needle holder
23 with just a ring around it like this, a separate ring.

24 The other thing that occurred to him was:
25 I could get the same kind of push-off action, the same

1 kind of release action if I put a little bridge between
2 them. If I connect them a little bit, as long as they
3 rake in the same place, they'll work the same.

4 So he staked out two different claims in
5 the '224 patent. One was this kind of claim on the
6 left. He used this friction ring in blue. There's the
7 plunger. That black bun thing is what pushes the
8 medicine down.

9 The blue is the friction ring that's
10 setting there in a barrel with all the friction ring
11 getting stuffed in sort of like a cork in a bottle.
12 That's what's holding it in.

13 The yellow is the needle holder. This is
14 the needle (indicates). There's this plunger. And what
15 happens is, as that plunger comes down, it knocks that
16 ring off.

17 Now, the second way he thought about
18 doing this is: Look, instead of having this separate
19 piece ring, I could just make the ring out of the same
20 stuff that the needle holder is out of and just put a
21 little bridge in between them.

22 We have covered where that bridge is with
23 red dots, so you can see it's just a break off. It's a
24 way to do the same thing, to break it off.

25 Both of these are his pieces of property.

1 There are claims in the patents for both of these pieces
2 of property. They are both his exclusive pieces of
3 property.

4 And what we will allege and prove to you
5 is that Becton Dickinson didn't do this, but they did
6 this (indicates). They did this. They used the bridge
7 and the ring and the needle holder in their product to
8 get exactly the same result.

9 Here's a copy of their product. This is
10 a copy of their 3cc syringe. Note some things about it.
11 It's got a plunger handle; it's got a collar, which
12 we'll show is for the same purpose as Mr. Shaw's
13 product; and it's got this needle.

14 And then up here in the nose, it's got
15 essentially the same piece, which I will show you here
16 in a minute. But, again, it works exactly the same.
17 Pops back, which is a good thing for safety. It's just
18 that Mr. Shaw invented it.

19 May I see the next slide?

20 Here's a little bit more about how this
21 works and I was describing to you. As the -- as the
22 plunger comes down -- that's the red arrow -- it hits
23 the ring, and it pushes the ring off.

24 See the ring over there on the right?

25 It pushes the ring off and allows the

1 needle to fly up.

2 I've got an animation that makes this
3 even a little more clear. Here we are delivering the
4 fluid. This isn't a true animation. This isn't
5 anybody's arm. Watch closely now, though, as the needle
6 is fired.

7 We have this blown up so you can see
8 inside.

9 The yellow right there is that little
10 ring. Here comes the plunger. It's just now pushing.
11 You see the ring pushing it off. It's pushing it off.
12 There we go. Go ahead.

13 And then once it pushes, it lets the
14 spring needle retract.

15 That's how Mr. Shaw's invention works,
16 and it works whether the ring is separate or the ring is
17 bridged. See that needle holder. You can break it off;
18 you can push it off. It's the same invention.

19 Lets look at BD's product now just very
20 briefly. This is the picture in Mr. Shaw's drawing that
21 shows -- I apologize; it's an engineering drawing.
22 But right here -- right here (indicates), we have the
23 same needle holder. This is the thing that holds the
24 needle. Here is the ring. And this little tiny piece
25 right there is the way that the patent showed a bridge.

1 This is the barrel. This is the end of the barrel, so
2 we're looking at a big blowup of just the part of the
3 syringe at the end with sectioned groups, an engineering
4 drawing of this piece right here (indicates).

5 Now, let's look at the infringing
6 product, which is the 3cc syringe.

7 Both -- they had to make two products, I
8 should mention. They had a small one and a large one.
9 I showed you the large one.

10 This is Becton Dickinson's small version.
11 I actually picked up Mr. Shaw's small version.

12 Here's Becton Dickinson's small version.

13 Again, watch the needle. Same kind of
14 action. There's the pictures.

15 Now, we've got engineering drawings from
16 Becton Dickinson. And Mr. Sheehan, our expert, is going
17 to talk about this in detail with you next week.

18 But let's see the engineering drawings.

19 Here we go.

20 Here's the 1 milliliter, the smaller
21 Becton Dickinson. But note, they both have this -- have
22 a little bridge right there between the two pieces. So
23 does the 3cc. This is the larger one. It's got that
24 little bridge right there.

25 We also have what we call a retainer.

1 Remember, that's that other ring. And then we also have
2 the needle holder. Those are claimed elements that are
3 in their product. They are in the words of the claim.

4 There's going to be a lot of talk in this
5 case about what's in these claims. And I'm sorry you
6 don't have the books, but you'll get them on Monday, and
7 that's really okay.

8 The boundaries of Mr. Shaw's property are
9 those claims. That's what you need to look at. And to
10 help you with that, the Court has already given us some
11 definitions of some of the words in those claims.

12 And every time our friends at Becton
13 Dickinson urge you that their product works differently
14 in some way, I urge you to look at those claims and
15 those definitions, because if you read them, you'll find
16 out what they're saying is different isn't.

17 For example, the term barrel, what's a
18 barrel? Does the barrel have to be one piece, or could
19 it made out of two pieces?

20 We'll see the definition, and it doesn't
21 make any difference. It really doesn't.

22 Retainer member. There's a retainer
23 member definition in there. It doesn't say retainer
24 member. It just says what has to happen to the retainer
25 member is that it's released -- the friction that's

1 holding it in the nose has to be released so the needle
2 can drive. It doesn't say it has to be released by
3 sliding action or breaking action or cutting action.
4 All those are included. Yet that's one of the
5 differences that they will urge.

6 Let's move to the second patent. I'm
7 sorry I'm moving so fast, but I've got three patents,
8 and I'm going to try to run through the last two very
9 briefly.

10 This patent is really about how the
11 device is used, and it's for the clinician, because I
12 showed you a minute ago that what we have here, when we
13 get through with this, is a nice little container. It's
14 down in here (indicates).

15 Now, you can -- you can dig this out of
16 here. If you had pretty good fingernails, you could
17 reach in there and dig that out. I can't do it right
18 now. I think if you're skilled at this, you could do
19 it.

20 But that's not the purpose. The purpose
21 is once it goes in, it's nice and contained.

22 In here also is a little vent, a little
23 hole in the plunger. And the reason for that is
24 Mr. Shaw discovered, by using that little hole, you
25 could reduce any -- the possibility of splatter coming

1 out in certain situations.

2 Their product and our product, if used
3 improperly, will spray fluid. We'll acknowledge that.
4 But if you put a little vent in the back and you use the
5 product correctly, in our case, retract it under the
6 skin, you're not going to get any splatter.

7 So Mr. Shaw filed the patent on those two
8 features. Here's the patent on it. In the '077 patent
9 right here, you'll see that drawing in this patent.

10 And look, it's the back end now, right?
11 The back -- here's the plunger handle. Here's the vent
12 we use, the little vent right there, and then you can
13 see that it's tucked into the back of this collar.

14 It's -- the claim says it becomes
15 ungraspable, which it does. It's not undigable; it's
16 not -- you can pry it out of there; but it's
17 ungraspable.

18 Let's look at BD's product. The 3cc
19 product is the one that uses this, it's the one I showed
20 you, and let's look at their engineering drawings.
21 That's how it works. It tucks in, and the plunger goes
22 in. And now let's look at the other drawing. Here's
23 the -- whoops. Here's their engineering drawing.

24 Again, they have this nice tall collar so
25 that the cap will go down below it, and it becomes

1 difficult -- it becomes ungraspable. That's why that
2 collar is there.

3 Last patent -- and I'm going to try to
4 give some time back to Mr. Bowles after I make a short
5 summary.

6 The last patent really has to do with --
7 the '733 patent has to do with how you make these
8 things. That's important. I mean, you remember I told
9 you there are a lot of designs out there, but if you
10 can't make them quickly using the manufacturing
11 equipment, you really can't deliver product, folks.
12 And Mr. Shaw got a third patent. Really goes to that
13 issue, how do you make these.

14 It's the '733 patent, and we have three
15 claims there that we're asserting against their lcc
16 product, the little product.

17 And here's basically what happens, is
18 Mr. Shaw figured out, if you -- if you made this a
19 one-piece body, which this is, and you made these parts
20 so that you could run them down to the end and squeeze
21 them like a cork into the end of the bottle, you could
22 put them all in the back automatically, shove them down
23 there on the nose, and have it made quickly and easily.
24 That seems like a -- not a big thing, but it's a huge
25 thing.

1 And let's look now at their product.
2 This is their version of that, and let's look at how
3 their product is made. These, again, are engineering
4 drawings from Becton Dickinson. I've made a movie to
5 show what happens.

6 All this stuff that's fed in from the
7 back up to the front and into the nose where it's held
8 by friction until a plunger comes down and pushes it off
9 and releases it.

10 Now, five minutes about, three minutes
11 about, what you're going to hear, I think, in defense, I
12 told you, in 1998 -- to come back to 1998, Becton
13 Dickinson decided they really had to have this, and they
14 didn't have one.

15 So they went and bought a little company,
16 and that company had its own design for one of these
17 things. And Becton Dickinson looked at that design, and
18 they're going to tell you that they used that design.
19 But here's the thing: That design -- in the design of
20 that product, it required something else to happen
21 besides just the pushing off, as I showed you, that was
22 used. It required the seal at the front of this. I've
23 lost my plunger.

24 This black seal, the thing that pushes
25 the medicine in, the way that company's design worked,

1 that seal had to slide back. So the way their product
2 worked was sliding backward, not just pushing forward.
3 Becton Dickinson bought that design, but you know what?
4 It wouldn't work. The company that sold it to them had
5 never made a shot needle to give anyone a shot. They
6 made some samples; they made some filings; they had
7 never been able to sell one, because they couldn't make
8 one that actually worked.

9 Becton Dickinson -- in fact, Becton
10 Dickinson engineers took that product, and over a
11 three-year period of time -- they bought the product in
12 1999, had it on their desk. It wouldn't work.

13 So over three years, they re-engineered
14 it. And what did they do? They made it so this seal
15 wouldn't slide back anymore. They made it so the seal
16 would stay upfront, just like Mr. Shaw's product, and
17 then what activates the syringe is the forward push of
18 the plunger.

19 Here's a design -- here's a 1999 circa
20 document. This isn't something I drew up. This is from
21 Becton Dickinson's engineering department, circa 1999.
22 There's our product at the top. That's the -- just the
23 plunger part. The syringe barrel is off. That's the
24 plunger part.

25 Here's the Saf-T-Med. That's the

1 Saf-T-Med Company that they bought. Notice this area
2 right here. Right here, there's the seal. Here's our
3 seal, right here, that pushes the medicine. Here was
4 the seal on this product.

5 And to operate, that seal had to -- see
6 it says, breaking tabs. They had to push back this --
7 the seal had to slide back that way.

8 The problem with that is, these syringes,
9 when you fire them, have about three times the pressure
10 in it that your garden hose has. Have you ever tried to
11 keep your thumb over the garden hose? That's about 40
12 psi. Inside these syringes, it's 120 psi.

13 So what's the problem with the design of
14 this? As you're pushing the medicine, this breaks
15 early. It could break early. If it breaks early, you
16 don't get the medicine.

17 BD engineers, when they looked at it and
18 studied it, said, well, we can't do that, so we'll do
19 this, and they throw this design out, and three years
20 later, in 2002, they brought out the product that I just
21 showed you with a thick seal at the front.

22 So here's a summary of what really
23 happened, even though they say something differently.
24 They used something in the front of our syringe. The
25 front of our syringe has this needle holder, so they

1 took that in the front, okay?

2 Then they went off to the back of the
3 syringe, and in the '077 patent, they took the collar.
4 Whoops. Well, they took the collar, this collar.

5 And then finally, they took something
6 from the middle. They took the fact that our seal was
7 fixed and took that. They put all three of those things
8 into their product.

9 I want to thank you for your attention in
10 this matter. I'm going to give what little time is left
11 to Mr. George Bowles.

12 Before I do that, I want to mention one
13 last thing, just ever so briefly. Saf-T-Med and my
14 client had a run-in in 1997 before Becton Dickinson ever
15 bought them or even knew about them.

16 There was a big flap. There were letters
17 back and forth. There were threats. What had happened
18 was, was that the product -- each company got ahold of
19 products from the other in an illicit way.

20 Saf-T-Med got ahold of one of ours that
21 they shouldn't have had; we got ahold of one of theirs
22 that we totally shouldn't have had. Mr. Shaw didn't
23 know what had happened.

24 Lawyers sent notes back and forth.
25 Nothing ever happened. It all went away. And the

1 reason it went away, frankly, was Mr. Shaw looked at
2 their product and said, well, I don't really care about
3 that product, the Saf-T-Med product. It's not going to
4 work. It's not a problem.

5 But three years later, it was a problem,
6 and we're here to ask you to help us defend Mr. Shaw's
7 property.

8 Thank you very much.

9 THE COURT: How much time remains?

10 COURTROOM DEPUTY: Four minutes.

11 THE COURT: Four minutes.

12 MR. BOWLES: Good afternoon. I'm George
13 Bowles, and this is going to be a sprint through
14 damages, let me tell you. I've got four minutes.

15 I want to go back to what Otis was
16 talking about when he said the hypothetical negotiation.

17 I've heard it described as sort of a
18 poker game. In fact, he said it a little bit. He said
19 that the hands of -- the cards in the hand of BD are
20 face up.

21 In a hypothetical negotiation, RTI knows
22 BD's hand, okay?

23 And it also knows that the patent of
24 Mr. Shaw is valid, it's enforceable, and it's been
25 infringed.

1 So I want to briefly, in three minutes,
2 go through just a few documents to show you, in the
3 spring of 2000, where -- sort of the mindset of BD and
4 what they were thinking in regard to the retractable
5 needle syringe technology.

6 Braden, let's go to the first document.

7 We know that in 1995 that -- we know, in
8 the early '90s, that BD had attempted to invent a
9 retractable needle.

10 By 1995, they had given up on it. They
11 said it couldn't be done. You see the language there?
12 Becton Dickinson engineers worked very hard to make this
13 idea work for us, but we could never get a retractable
14 needle syringe to perform to the standards we feel meet
15 our customers' needs and expectations.

16 That's 1995.

17 1997 -- let's go to the next slide.

18 In 1997, in a -- in a meeting called
19 Safety Day at BD that Mr. Kozy actually attended -- in
20 fact, this document, he's the first name on the
21 document -- BD concluded that they would make no further
22 investment in safety syringe technology, because that's
23 not where the money was.

24 But at that very time, Mr. Shaw and RTI,
25 their product hit the market, and it was a hit in the

1 market.

2 Let's go to the next document.

3 This is an internal -- and these
4 documents are BD documents. They are not our documents.
5 They were produced to us during discovery in this case.

6 Let's go to the next page.

7 This is internal at BD. This is a --
8 December of 1998, a little over a year and a half after
9 RTI's product hit the market.

10 It says, Bigger market allows more than
11 one platform to be profitable. Aggressive look at
12 retractables. RTI has proven that concept is inherently
13 attractive to customers.

14 Braden, next document.

15 This is a few months later. Again, this
16 is internal at BD.

17 Many customers are excited about
18 retractable syringe technology. Many customers are
19 asking BD about it. Some customers are equating
20 retractables with superior technology.

21 Here's another document to a bunch of
22 people at BD. One of them is to Mr. Kozy. And when I
23 say Mr. Kozy, this is the corporate representative of BD
24 here in the courtroom today.

25 In the last year, BD has aggressively

1 started reevaluating the merits of retracting needle
2 technology for skin injection as new designs have
3 surfaced that deliver considerable improvements over the
4 two-handed, multi-step retractable syringes reviewed and
5 rejected in the mid-1990s.

6 So by the end of 1999, BD saw that the
7 syringe -- safety syringe market was moving quickly away
8 from it, and it was moving to a retractable -- the
9 retractable needle device.

10 In fact, let's go to the next one.

11 Internal document. Market research has
12 confirmed -- this is in November of 1999.

13 Market research has confirmed this, which
14 is the retracting -- this is the product that BD was
15 developing that --

16 THE COURT: Mr. Bowles, I'm told your
17 time is concluded. You'll have to save the rest of the
18 story for next week.

19 MR. BOWLES: Thank you very much, Your
20 Honor.

21 THE COURT: Mr. Beck?

22 MR. BECK: Your Honor, could the Court
23 give me a 10-minute warning? Would that be okay?

24 THE COURT: Yes. Ms. Martin, if you'll
25 let me know when 10 minutes remain.

1 MR. BECK: Thank you, Your Honor.

2 Ladies and Gentlemen, we're going to be
3 working together for about the next five or six days to
4 resolve the dispute that we have between the parties
5 here.

6 And this process is what the Judge, over
7 a hundred years ago, said was a sacred process, and I
8 firmly believe that this process we're all participating
9 in is, in fact, a sacred process.

10 Now, as you listen to the evidence that
11 you're going to hear next week, I ask you to keep
12 basically four points in mind.

13 The first point is that Mr. Shaw did not
14 invent the retractable syringe, and he also was not the
15 first inventor to receive a patent on a retractable
16 syringe. And I don't think there's going to be any
17 question about that at all.

18 The evidence will show in this case that
19 there were a lot of people in this country and elsewhere
20 that were concerned about this problem of needlesticks
21 that we don't -- nobody disputes that in this case.

22 You had people -- other people in Texas
23 that were working on it. You had other people in other
24 states that were working on it. You had people in other
25 countries that were working on it.

1 And you're going to learn that a man
2 named McGary and a man named Jentzen, who are both
3 Texans, were working on the same problem. And they came
4 up with their own idea for a retractable syringe, and it
5 was different. It was significantly different than the
6 technology that Mr. Shaw came up with.

7 Mr. Shaw unquestionably believes that his
8 is the best and his is the only one that works. That's
9 not going to be an issue that you-all will be asked to
10 decide, because you've got other inventors who believed
11 that theirs worked as well, because they got patents on
12 it.

13 So that's the first thing I ask you-all
14 to remember.

15 The second thing I ask you to remember is
16 that, because many others before Mr. Shaw received
17 patents, Mr. Shaw was only entitled to a patent if he
18 was able to show the Patent Office, our Patent Office,
19 an adjunct to the Federal Government, what he came up
20 with was new and different from what preceded it.

21 In other words, if somebody else before
22 him had acquired a patent or many had acquired patents
23 and he wanted a patent on a retractable syringe, he had
24 to go to the Patent Office and say, I've got a different
25 invention, a new invention. It's different. It's

1 different from what has preceded me in this case.

2 And when he filed his patent, he told the
3 Patent Office that he had a specific type of a
4 retractable syringe, one in which the needle was held in
5 place by -- entirely by friction or clamping, friction
6 or clamping.

7 And you're going to hear that that
8 technology is fundamentally different from the
9 technology that was developed and designed and employed
10 by a Mr. McGary and a Mr. Jentzen from Austin, Texas.

11 And we are going to show you, Ladies and
12 Gentlemen, that that cutting technology is the
13 technology that is employed in the Integra products that
14 are at issue in this particular lawsuit.

15 Now, don't take my word for it, because
16 whenever you tell the Patent Office something, they make
17 a record of it. This is the -- one of Mr. Shaw's
18 patents that's in dispute here. This is his patent
19 application here. Excuse me. This -- he filed it on
20 September 29, 1995.

21 What does it say? Well, he tells the
22 Patent Office why his is different from what preceded
23 it. And I will tell you and we will prove to you,
24 Ladies and Gentlemen, that Mr. McGary and Mr. Jentzen
25 got a patent, and they got a patent before Mr. Shaw even

1 filed any of his three patent applications in this case.

2 And what Mr. Shaw is telling the Patent
3 Office after he filed his application, he says the prior
4 art -- and remember, you're going to be hearing about
5 prior art. It's what came before him, what patents
6 existed before him, what the literature said before him.
7 Mr. Shaw is telling the Patent Office: The prior art
8 has not recognized a retraction mechanism with separable
9 parts that rely entirely on clamping force or friction.
10 That's what was represented to the Patent Office.

11 Well, remember, and we will show you,
12 that Mr. McGary and Mr. Jentzen's cutting technology was
13 before. That's what he's talking about there, that what
14 came before is different from mine, and therefore, I am
15 entitled to a patent.

16 Well, the third thing I ask you-all to
17 remember in this case, and that is, that you can't have
18 it both ways. If to get a patent, you're going to say
19 that your technology is a certain way, after you get
20 your patent, you can't then come in and say after the
21 fact, well, wait a minute, my technology is really --
22 really covers what preceded it.

23 You can't have it both ways. And we say
24 that's what is at issue in this case.

25 The third thing I want you-all to

1 remember is that in 1990, Mr. Jentzen and Mr. McGary
2 invented a retractable syringe that used a cutter
3 retraction mechanism. You're going to hear that a lot
4 in this case, a cutter retraction mechanism.

5 And they worked hard to develop that
6 during the 1990s, and BD, my client, was so impressed
7 with their invention, that it purchased all of the
8 rights, the patents, that that company had for \$17
9 million.

10 And our position in this case is the
11 technology that Mr. Jentzen and Mr. McGary came up with
12 that was part of this Saf-T-Med Company, our client came
13 in and said, we like this technology. It not only has
14 this cutting mechanism that we really like, but it also
15 has the detachable needle, which is another factor that
16 we think that healthcare workers would really like in
17 the marketplace.

18 And so we bought that company, a company
19 called Saf-T-Med, that we paid \$17 million for.

20 The fourth thing I ask you-all -- and
21 bear in mind, that's the technology that Mr. Shaw
22 criticized whenever he was getting his patent.

23 The fourth thing I ask you to keep in
24 mind is that our products, Integra products, use this
25 cutting technology, not the friction or clamping

1 approach of Mr. Shaw.

2 And I want to ask you, Ladies and
3 Gentlemen, an example of -- and I know it's hard to see
4 these, so we've got a blowup, and I want to tell you,
5 this is not our needle in the sense that it's not this
6 big, but I want to show you the model that we have. So
7 I don't want to scare anybody.

8 Your Honor, may I just step real
9 briefly -- and this is not our regular syringe, so I
10 want you to know that.

11 But, basically -- Lisa, can you help me a
12 little bit?

13 This is the cutting -- this is the
14 cutter, and you're going to see a lot about that here.
15 And I'm just going to very simply -- and the cutter
16 comes down, and it actually cuts through this right
17 here. And when it does so, this needle springs back.

18 So you're going to hear a lot about this
19 cutter and this cutting technology in the case. And
20 that, Ladies and Gentlemen, is one of the big issues in
21 this lawsuit, because the two products at issue here,
22 the Integra 3ml and the Integra 1ml both use this cutter
23 technology. They both use the cutter technology.

24 Let me tell you a little bit about Becton
25 Dickinson. Some of you may have heard about the

1 company; some of you may not have heard about the
2 company.

3 As I said earlier, the company was
4 founded up Highway 59 in Texarkana at a train station
5 where you had two people shake hands, make a deal,
6 decided we were going to build a company, try to make it
7 one of the best companies we could, and they did so.

8 And here we are more than a hundred years
9 down the road. And it's a big company, as I said to
10 you.

11 But I represent the men and women of this
12 company, and they've spent a lot of time doing a lot of
13 good hard work to develop a lot of really good products.

14 I'm talking about syringes. I'm talking
15 about other devices that are used for injection. I'm
16 talking about medical devices.

17 The people are proud of those devices,
18 just as they are proud of what they've come up with.
19 And I'm not trying to denigrate that in any way.

20 But, Ladies and Gentlemen, whenever our
21 client comes up with a product, it has manufacturing
22 standards. And you've seen references to those in the
23 documents you've seen.

24 They've got to somehow be able to
25 manufacture a product that is good quality, that is low

1 cost and can be manufactured on a large scale.

2 Otherwise, it just doesn't work.

3 And we say that that's what happened in
4 this case after we purchased this technology from this
5 company called Saf-T-Med.

6 But let's look at some of the other
7 medical milestones that Becton Dickinson have been
8 involved in.

9 1924, just 27 years after the company was
10 founded, Becton Dickinson introduces the first insulin
11 syringe for patients with diabetes. 1924.

12 1954, supplied Jonas Salk, the inventor
13 of the polio vaccine, with fringes -- or syringes for
14 polio vaccines.

15 '60s, first mass provider of disposable
16 syringes.

17 '70s, developed technology for cancer,
18 stem cell, and AIDS research.

19 1980s, donates hundreds of millions of
20 syringes to Unicef each year to help eliminate neonatal
21 tetanus. It was killing over 400,000 people per year.
22 That's another milestone that this company has been
23 involved in.

24 And then when we get into the -- '89, we
25 get into the safety lock, which is a safety syringe

1 we're talking about. They don't like that safety
2 syringe. They criticize our safety syringe. Well, we
3 think it's a good product. It's a different product.

4 1991, we come up with a safety compliance
5 initiative launch, and we'll talk more about that during
6 the evidence.

7 1996, the safety glide, which is another
8 safety product. They don't like that one either.

9 2002, we introduced the Eclipse, which
10 are the two -- two of our products that are being
11 criticized in this case.

12 And then 2002, where we also had both
13 the -- the 3ml Integra as well.

14 And I want to tell you something that I'm
15 particularly proud of. Most recently, Becton Dickinson
16 is working on a technology that administers medicine
17 without any puncture of the skin, which, hopefully, will
18 eliminate needlesticks altogether.

19 So much for Becton Dickinson.

20 Now, let me turn now to Mr. Jentzen and
21 Mr. McGary.

22 In the late 1980s, a lot of companies --
23 not just RTI, not just Mr. Shaw -- were trying to
24 address this issue of needlesticks. A lot of people
25 were trying to do it, and Mr. Jentzen and Mr. McGary

1 were, too.

2 And let me tell you about their story.

3 Mr. Jentzen and Mr. McGary had both been
4 laid off from their company. One was an aerospace
5 engineer. And they were trying to -- and one of them
6 happened to be watching television and saw something
7 about these needlestick injuries.

8 And thank goodness, there are people like
9 this, because he said, maybe I can do something about
10 this. And he educated himself. He read. He went to
11 the library. He read articles.

12 And then he and Mr. Jentzen got together
13 and both worked in an effort to try to come up with
14 something. They eventually met a man named Erbs,
15 E-R-B-S.

16 Now, Mr. McGary is deceased, so we can't
17 hear from him.

18 You're going to hear from Mr. Jentzen.
19 We've got his sworn deposition testimony. You're going
20 to see his video and hear his testimony. And you're
21 going to hear from Mr. Erbs in this case.

22 And they're going to tell you about this
23 technology, and they're going to tell you about
24 Saf-T-Med, and they're going to tell you about the
25 products that they hit them up with so that you better

1 understand the technology that we say eventually evolved
2 into the Integra products that are involved in this
3 particular case.

4 Let's look at some of the other patents
5 that have been involved in the matter.

6 This is the patent that Mr. McGary and
7 Mr. Jentzen from Cedar Creek, Texas, got. They filed it
8 in October 3rd, 1990. Here it is.

9 Let's look at the next one.

10 This is by a man named Mr. Harry Kaufhold
11 and others from Houston and Cypress Creek, Texas. They
12 filed for a patent on a retractable syringe in 1995.

13 Here's another one by a Mr. John Toft,
14 who filed a patent application for a retractable syringe
15 in 1992.

16 The next one is by a Mr. Elgene
17 Gillespie, who's from Ohio. He filed for his in May of
18 1992.

19 The next one is Mr. Murray. He filed for
20 his in September of 1992.

21 And these are all patents on retractable
22 syringes, Ladies and Gentlemen.

23 And then we go to a Mr. Caselli, who
24 files on May 4, 1992.

25 And then we get to a Mr. Marshall, who

1 filed for his in September of 1991.

2 These seven patents that I have showed
3 you all came before Mr. Shaw received -- even filed for
4 patent applications that were involved in this case.

5 In other words, these seven had already
6 gotten their patents before Mr. Shaw even filed for his
7 in this case. He didn't file for his patent application
8 until '95, and it wasn't approved until 1997.

9 Why is this important? It's important
10 because, just because they have a retractable syringe
11 and we have a retractable syringe, that's not the end of
12 the analysis. A lot of people had ideas and inventions
13 and patents for retractable syringes.

14 What you need to look at is, what is
15 important, what is critical in these inventions, and
16 what is different in these inventions? Because as
17 you've already heard, there are a lot of parts that are
18 very, very similar in this case.

19 If we can show the syringe.

20 You know, you've already heard about the
21 barrel. You've already heard about the thumb cap.

22 You've already heard about the needle
23 assembly.

24 And nobody disputes that. I mean,
25 everybody agrees that in parts of retractable syringes,

1 a lot of parts are the same. But that doesn't mean
2 anybody's infringing anybody's patent.

3 As you'll see, some of these patents that
4 preceded Mr. Shaw's patents had very similar attributes
5 as well in this case.

6 Now, we say, and we intend to prove, that
7 Mr. Jentzen and Mr. McGary were among the first
8 inventors to develop this unique technology of a
9 cutter -- cutter technology.

10 And when you see how this technology
11 developed, you'll see, for example, why there are major
12 differences between the two.

13 If we could go to the next slide, please.

14 I mentioned before the patent that
15 Mr. McGary and Mr. Jentzen had received. This is one of
16 the figures in their patent. And you see, for example,
17 it's got the -- you know, the -- it's got the thumb cap.
18 It's got the barrel. It's got the needle assembly.

19 Again, this is before Mr. Shaw received
20 any patent.

21 And you're going to hear a lot in this
22 case -- and we showed it to you in this demo -- in here
23 is where this cutter is, this cutter that we're talking
24 about.

25 And this cutter moves forward, cuts

1 through here, and once it cuts through that seal,
2 usually rubber or plastic, then the needle shoots back
3 into the -- into the syringe and accomplishes the
4 retractor -- the retractability that we're looking for
5 in this case.

6 And here's what Mr. Jentzen and
7 Mr. McGary said about theirs. You've already seen what
8 Mr. Shaw said and why his is different from what existed
9 before.

10 Here, Mr. McGary -- and we're going to
11 talk about a cutting tip configured inside the sealing
12 member wherein the cutting tip is a cylindrical cutting
13 means or knife extendable through the member.

14 In other words, it's a cutter, like a
15 knife that's going through here. That was different.
16 That preceded what Mr. Shaw told the Patent Office. He
17 said his was different than that.

18 But Mr. Jentzen and Mr. McGary went
19 further, and they explained how their cutting tip or
20 knife worked, and they talked about how it works by the
21 cutting tip extending through the retainer thereby
22 causing the biased needle to be released into the
23 plunger.

24 So they not only showed the Patent Office
25 how it worked, they told them exactly why it worked the

1 way that it did. And that's when they got their patent.

2 Now, you notice this doesn't say anything
3 about clamping or friction, clamping or friction that
4 Mr. Shaw's patent does.

5 Well, what happened after they got their
6 patent? Well, I told you about Mr. Erbs and Saf-T-Med.

7 Well, here's an example of one of the
8 first prototypes that Saf-T-Med came up with. And I
9 know you can't see that real well, but up in here,
10 that's where the cutter is. This is one of their first
11 prototypes, Mr. Jentzen and Mr. McGary.

12 You can't very well see it here, but you
13 can see it up there. That's one of their first
14 prototypes. But they kept working on it. They kept
15 trying to improve it, make it better, and they
16 eventually did so.

17 And over the next several years, they
18 worked to try to come up with what they believed was a
19 commercial product out of their invention.

20 Now, once Mr. Erbs got involved, he was
21 more of a businessman as opposed to an engineer. And so
22 Mr. Erbs is trying to get this moving forward in an
23 effort to try to make this a commercial product.

24 And one of the things he does, he goes to
25 the Food and Drug Administration, and he gets approval

1 from the Food and Drug Administration to market this
2 particular product. He got that in January of 1998.

3 So you can see the timeline here. Come
4 up with the patent. They get Mr. Erbs involved.
5 Mr. Erbs goes to the FDA. And in January of 1998, he
6 gets the approval of the FDA.

7 This next slide shows you an example of
8 the Saf-T-Med syringe as it was developing over time,
9 and you'll see that's where the cutter is. The cutter
10 is in here, and they cut through here, and then the
11 needle shoots back.

12 And here, this is just the needle
13 assembly. This is the cap that fits over the needle
14 assembly. So you can see, from the prototype you've
15 seen, how this thing is progressing over time.

16 Now, you heard that, well, Saf-T-Med and
17 RTI had a little bit of a run-in. Well, we'll get into
18 that during the course of the trial. There ain't no
19 question they had a run-in. And after they had that --
20 BD's not involved in this. This is between Saf-T-Med
21 and RTI.

22 Well, during this run-in, when there were
23 lawyers writing back and forth, you know what? They
24 never accused Saf-T-Med with this cutting technology of
25 somehow infringing on their technology or their patents.

1 Never once did they accuse them.

2 Now, they're going to tell you now, well,
3 it just didn't work. Well, it did work. It did work.
4 It was different, but it worked.

5 Now, as you learned this morning in the
6 video about the patent process, you can get a patent
7 when something you come up with is new, and it's useful.
8 That means when you -- to get a patent, you have to show
9 that what you -- what you've come up with, your idea, is
10 different, different than what came before it, the prior
11 art, as you've heard referenced already.

12 When the Patent Office issues a patent,
13 it's made a determination, at least based on the
14 information before it, that what preceded it is
15 different and it is usable.

16 And you're going to be asked some
17 questions in this case about invalidity and whether a
18 patent is or is not invalid in this case.

19 Our position is, just so we're clear,
20 that you cannot have it both ways. You cannot represent
21 to the Patent Office that what came before it, for
22 example, McGary and Jentzen, is different, and
23 therefore, you're entitled to your patent. And then
24 after you get your patent, say, no, it's not different.
25 Our patent covers that. You can't have it both ways.

1 You will have -- you will not have to
2 decide in this case which product is better. They think
3 their product is better, and that's fine. They think
4 their product is great, and that's fine. We think our
5 product is a good product, but you're not going to be
6 asked to decide that case.

7 But you are going to be asked to decide
8 whether or not our technology and our retractable
9 syringe violates their patent. We say it does not; they
10 say that it does.

11 But we also say that Mr. Shaw's own
12 statements to the Patent Office confirm that our
13 technology is substantially, materially, and
14 significantly different from the technology that he came
15 up with, mainly, the cutter technology that we're going
16 to be getting more into during the course of the
17 evidence in this case.

18 Let's look at the next slide, please.

19 This is what Mr. Shaw said of the '733
20 patent. One of the problems of the prior art of
21 retractable syringes is the sheer number and complexity
22 of parts, which must be formed and assembled. Other
23 problems with the prior art are dependence on flexing or
24 breaking of internal parts by the plunger in order to
25 release the mechanism.

1 In other words, there's something that's
2 going through or cutting, which might end up in the
3 breaking of internal parts.

4 And our technology, you do cut through
5 seams. He's criticizing that, saying that that's one of
6 the problems with the prior art. That's why we need our
7 patent. It's different, it's new, and it's useful.

8 Small broken-off pieces can present a
9 risk of hang-ups. So you can't criticize a technology
10 on the one hand to get a patent, and then later come on
11 and say, no, no, our patent actually covers that cutting
12 technology.

13 Now, Judge Folsom is going to explain
14 patent claims and elements at the conclusion of the
15 case, and we believe that he will tell you that in order
16 to find that an accused product infringes a patent, you
17 must find that the accused product violates every
18 element of every claim in the patent.

19 And the Judge is going to instruct you
20 about certain terms and what they mean, and those are
21 the terms that you must follow in the case.

22 There are four issues, four basic
23 questions that we think you're going to be asked that
24 relate to this infringement issue.

```
25 |         One is:  Do the Becton Dickinson Integra
```

1 syringes use clamping or frictional force to hold the
2 needle in place?

3 Our position is, it does not. Our
4 position is that this cutting mechanism and this seal is
5 what holds it in place. And after the cutting mechanism
6 goes through, that's what causes the needle to retract.

7 Second question: Are frictional forces
8 or clamping forces released in the Integra syringes when
9 the needle is retracted?

10 Again, the answer is no, because friction
11 and clamping is not what holds the needle in place, and
12 it's not what releases the needle whenever that friction
13 or clamping is somehow lessened.

14 Third question: Do the Integra syringes
15 have a vent through which air flows?

16 Again, our position is that they do not.

17 You will hear in this case, for example,
18 about what are called core pin holes.

19 They've got some vents that they say are
20 in their product. We don't have vents in our product,
21 and I'll talk about that a little bit more in just a
22 moment. But that's another issue that you're going to
23 have to be -- you're going to have to address in this
24 case.

25 You were told a few moments ago that we

1 should have come to them and somehow asked their
2 permission to come forward with this cutting technology.
3 You've also heard that they came to us and wanted us to
4 buy their technology. Our people, and they will tell
5 you, didn't like their technology. It didn't have a
6 detachable needle. It had other features that our
7 people did not like. And so we told them no.

8 They tried to sell it to other companies,
9 and you'll hear a little bit more about what other
10 companies said about their technology.

11 But our people did like this cutting
12 mechanism technology, because they thought it was new
13 and different, and they also liked this idea of the
14 detachable needle for reasons our people will talk to
15 you a little bit about during the evidence.

16 Bill Kozy, you're going to hear from
17 him during the course of the trial. He's Executive
18 Vice President of the company, and he'll tell you
19 that one of the major reasons our client was not
20 interested in VanishPoint was because of this
21 detachable needle that their technology did not have.

22 You will hear evidence that Mr. Shaw went
23 to other companies to try to sell his product, and other
24 companies reached the same conclusion that Becton
25 Dickinson did, specifically a company called Sherwood.

1 BD looked at technology covered by a lot of patents, and
2 we focused on the cutting technology that I've told you
3 ladies and gentlemen about.

4 Saf-T-Med came to BD, wanted to partner
5 with us, and that's when our client, after being so
6 impressed, decided to buy the company for \$17 million.
7 After that, we began working on what eventually became
8 the Integra syringe, and you'll hear from Mr. Kozy and a
9 person named Chad Smith, both of whom work for BD. And
10 they'll get into that in more detail with you.

11 Did Becton Dickinson make any changes to
12 the Saf-T-Med design?

13 You bet they did. They had to somehow
14 make certain that their manufacturing standards were
15 satisfied and honored in this case.

16 But did Becton Dickinson change the basic
17 cutter mechanism concept?

18 The answer is, no, they did not. And our
19 people will explain that in more detail to you as well.
20 I want to show a short animation that shows the
21 difference between the two products.

22 First, we're going to show the RTI
23 product and how theirs works.

24 If we can run that, please.

25 (Animation playing.)

1 MR. BECK: That's the friction and
2 clamping we're talking about. The needle retracts.
3 Now let's look at the BD technology and how it works,
4 please.

5 This is the BD cutter mechanism
6 technology. You see the cutter. The cutter goes
7 through, and then the needle retracts back into the
8 syringe.

9 You will hear from a Dr. William (sic)
10 Sibbitt, who's a medical doctor, who's not only a good
11 medical doctor, but he's invented syringes, and he'll
12 talk about the products involved in this case.

13 Now, I said I was going to mention vent
14 holes for just a moment. In addition to explaining how
15 these retraction mechanisms in these two different
16 products work, Dr. Sibbitt will talk about what are
17 called vent holes.

18 Now, Mr. Shaw includes in his patent the
19 requirement that you must have vent holes during the
20 retraction process.

21 The BD Integra does not have vent holes.
22 It does have, however, what are called core pinholes.
23 And during the manufacturing process, you will have
24 holes that actually will hold the device while the
25 plastic is being laid, if you will. And those are my

1 terms.

2 This is the outer plunger. The inner
3 plunger actually fits -- in other words, this fits into
4 this. See, here's the cutter mechanism here.

5 And you're going to hear about the vent
6 holes. Well, the vent holes -- here -- here are the
7 vent holes that they're alleging took place. These are
8 core pinholes.

9 These actually hold the device in place
10 during the manufacturing process. They're not a
11 designed vent hole that somehow was intended to release
12 airflow, unlike the product that RTI has in this case.
13 Instead, our core vent (sic) holes are actually in the
14 inner plunger, whereas theirs is substantially
15 different.

16 And their argument is that somehow they
17 put theirs in to reduce blood spatter. These core
18 pinholes aren't put in ours to reduce blood splatter.
19 It's solely as a result of the manufacturing process.
20 So the purposes are even different.

21 The last thing I want to talk to you
22 about is what is called inaccessible for grasping,
23 because Mr. Shaw's patents also cover a plunger that
24 must be inaccessible for grasping after the syringe has
25 been fully activated and the needle has been retracted.

1 Well, we believe the evidence will show that the Becton
2 Dickinson plunger is accessible after the syringe has
3 been fully activated. In fact, we asked Mr. Shaw, when
4 we took his deposition, to somehow pull it out to see
5 whether or not it was accessible, and he did so.

6 If we could show that, please.

7 (Video playing.)

8 QUESTION: Okay. Okay. Can you pull the
9 plunger out and show me the tip of the plunger, what it
10 looks like?

11 ANSWER: Hmmm.

12 (End of video clip.)

13 MR. BECK: So you see, he was able to
14 pull out the part of the device that is supposed to be
15 inaccessible for grasping based upon one of his patent
16 requirements.

17 Let me turn now to the issue of
18 invalidity. And I'm just going to spend very little
19 time on this.

20 As I explained before, when someone
21 obtains a patent, he or she is entitled only to a patent
22 on something that is new or different.

23 If something was addressed by a prior
24 patent and we show you by clear and convincing evidence
25 that it was, in fact, shown by a prior patent, then that

1 patent, at least that part of it, is invalid.

2 And although the Patent Office tries to
3 avoid issuing invalid patents, sometimes it happens, as
4 you've seen from that video that His Honor showed
5 you-all earlier today.

6 The Patent Office has to make a lot of
7 decisions, and they make decisions based on the
8 information they have before it or what's been called to
9 their attention.

10 The evidence will show, we believe, that
11 there are at least two instances in which Mr. Shaw's
12 inventions were, in fact, covered by earlier patents,
13 and, therefore, at least in that respect, they are
14 invalid.

15 And first, if you accept what Mr. Shaw is
16 now saying, that his patents cover everything, including
17 cutting, then you should find the patent invalid,
18 because his patent actually criticized cutting, because
19 that took place and was patented before him.

20 The vents requirement in the '077 patent.
21 There's a man named Gillespie, who filed for a patent on
22 May 8th, 1992, and he got his patent in 1993.

23 And here's a man, again, before
24 Mr. Shaw's patents, that talked about vent holes. And
25 he talks about the chamber is vented at its rear end --

1 THE COURT: Mr. Beck, you have 10
2 minutes.

3 MR. BECK: -- by vent holes.

4 Thank you, Your Honor.

5 So we see again, here's somebody else,
6 before Mr. Shaw got his patents in this case, who had
7 vent holes. We don't even have vent holes. But if you
8 have to have vent holes, it clearly shows that somebody
9 had vent holes as part of this retractable syringe
10 technology before Mr. Shaw did.

11 This idea of having vents in a syringe
12 was not new at all, and nowhere in Mr. Shaw's '077
13 patent is there any reference to this Gillespie patent
14 that we've talked about just a few moments ago.

15 And we say, because the Gillespie patent
16 was first, and it had vents in the plunger, that Claims
17 10 and 25 of the '077 patent should be invalid.

18 With respect to the inaccessible for
19 grasping requirement in the '077 patent, again, previous
20 patents, including McGary and Mr. Jentzen's prior
21 patents, had already come up with that idea as well.

22 So there was nothing really new about
23 that at all.

24 So you can see we've got a dispute here.

25 We've got a real dispute and a genuine

1 dispute. But, Ladies and Gentlemen, no one has a
2 monopoly on good ideas. There are a lot of people that
3 have good ideas.

4 And just because one person has a good
5 idea and believe they've got the best idea, that doesn't
6 mean other people don't have good ideas, too.

7 And our people believe that other people
8 did have good ideas. And our people liked the
9 technology that these other people with good ideas came
10 up with. And our position is that our Integra products
11 really relied on that technology. We developed our
12 products based upon that technology.

13 And so in conclusion, I just simply want
14 to say that our position is very simple, and that is,
15 you cannot tell the Patent Office one thing about
16 earlier patents and say that somehow I'm entitled to a
17 patent, because what existed before is no good, what
18 existed before is different. And then after you get
19 your patent, say, ah-ha, what existed before my patent
20 somehow trumps that.

21 It's not right. We say that it's
22 improper, and probably what's worse, it's not fair.
23 It's just not fair.

24 We look forward to working with you-all
25 during the next five or six days in addressing this

1 dispute, and, hopefully, it will be an enjoyable
2 experience for everybody.

3 Thank you-all very much.

4 THE COURT: Thank you, Ladies and
5 Gentlemen, for your attention. I know it's been a long
6 day, and we're going to allow the jury to go, just
7 simply recalling my instructions not to discuss this
8 case, investigate it in any fashion.

9 Return at 8:45, 8:50 Monday. We'll try
10 to start promptly at 9:00 a.m. Have a pleasant weekend.

11 Mr. Potts, if you'll escort the jury out.

12 COURT SECURITY OFFICER: All rise for the
13 jury.

14 (Jury out.)

15 THE COURT: Please be seated.

16 Let's talk about Monday's events. What
17 might we expect from RTI by way of testimony Monday,
18 Mr. Carroll, Mr. Bowles, Mr. Hardin, by way of
19 witnesses?

20 MR. BOWLES: On Monday, Your Honor, we
21 will have Kathryn Duesman. Then we'll have Neil
22 Sheehan, who is a technical expert. Then we'll have
23 Mr. Shaw. Those are three witnesses.

24 And then we'll have some videos. We'll
25 call Dr. Hyman after that.

1 THE COURT: Sounds like a full day.

2 Any -- we'll talk about remaining exhibit issues, but
3 any slides to be exchanged concerning these witnesses
4 that haven't been furnished to BD, aside from exhibits?

5 MR. HARDIN: Yes, Your Honor. There will
6 be some slides for Mr. Sheehan's testimony.

7 THE COURT: When do you expect those to
8 be provided to BD?

9 MR. HARDIN: We agreed 36 hours.

10 THE COURT: What I want to avoid, though,
11 is like yesterday, I received a call at 4:00 o'clock.

12 We've got -- we've got problems, Judge.
13 I'm waiting at the office until 5:30. I have yet to
14 receive them. My clerk says some of them came in at
15 7:00 o'clock.

16 You know, we don't like to be addressing
17 these issues Sunday night at 10:00 p.m. and on the way
18 down, so --

19 MR. HARDIN: Your Honor, we're meeting
20 over the weekend. We will confer over the weekend
21 and --

22 THE COURT: Well, I want to -- I want to
23 know by no later than noon --

24 MR. HARDIN: Easily, Your Honor.

25 THE COURT: -- Sunday if there are any

1 issues.

2 MR. HARDIN: If there's an issue.

3 THE COURT: And the nature of the issue
4 and give us a copy of the slides by e-mail. I think you
5 all have Mr. Kizer's e-mail address. That way it gives
6 us a little time to look at those issues before Sunday
7 night.

8 Now, anything else concerning Monday's
9 events? And I want to take up these exhibit issues in a
10 minute, but --

11 MR. BECK: Judge, just for planning
12 purposes, we're going to invoke the Rule on Monday, Your
13 Honor.

14 THE COURT: Very well.

15 MR. HARDIN: Your Honor --

16 THE COURT: Mr. Shaw is a Plaintiff
17 individually, and you have a corporate representative,
18 and, obviously, BD is entitled to a corporate
19 representative.

20 MR. HARDIN: Your Honor, I don't have the
21 wording of Your Honor's motion in limine in front of me,
22 but with all due respect, I think Mr. Beck stepped over
23 the line on the motion in limine, and we would like to
24 consider asking for a corrective instruction.

25 THE COURT: What area?

1 MR. HARDIN: The idea that Mr. Shaw's
2 patents can't cover cutting technology in particular. I
3 think Your Honor was pretty clear in the motion in
4 limine that -- that an argument that Mr. Shaw's patents
5 were -- could not cover cutting and breaking; in other
6 words, to release the friction was not appropriate.

7 THE COURT: Mr. Beck, you want to make
8 any comment?

9 MR. BECK: Judge, I didn't say that.
10 What I said was that's the issue in the case. Their
11 position is it covers it. Our position is it doesn't.

12 THE COURT: This is going to be a very, I
13 think, hotly contested issue throughout the trial on
14 going over the line in the motion and as to the motion
15 in limine, and I'll take a look at the transcript over
16 the weekend and look at it closer.

17 I thought both of you sort of flirted
18 with violating some of the Court's orders and some of
19 the -- sort of what I consider the trial of a patent
20 claim as comparing the asserted claims to the accused
21 device.

22 We had all sorts of comparisons between
23 the RTI device and the accused device, and I'm just very
24 quietly watching, but I'll take a look at the
25 transcript.

1 My clerk reminds me to ask, is the
2 Doctrine of Equivalents still in this case?

3 I noticed from the pretrial order there
4 was a -- that claim being asserted, and then in the jury
5 instruction, there was no instructions on that issue.
6 Does the Plaintiff still have it in the case?

7 MR. HARDIN: Your Honor, I don't believe
8 so. I think we'll withdraw the Doctrine of Equivalents.

9 THE COURT: So that's out. That's out of
10 the case.

11 MR. BECK: Yeah.

12 THE COURT: I trust the Defendant
13 doesn't --

14 MR. BECK: We agree with them, Judge.

15 THE COURT: Very well.

16 Mr. Beck, you made the comment during
17 jury selection, there are only two claims, which there's
18 an argument of invalidity. Is that a correct statement?
19 What -- what is the --

20 MR. BECK: I think it was Claims 10 and
21 25 of the '077 patent. Yeah. I mean, there are
22 other -- there are other claims, but what I was talking
23 about is, with that particular subject, it was just
24 those two claims.

25 THE COURT: I see.

1 So whatever claims of invalidity are
2 stated in your pretrial order, you're still standing on
3 those?

4 MR. BECK: That's correct, Your Honor.

5 THE COURT: Any other matters?

6 MR. DAWSON: Your Honor --

7 THE COURT: The exhibits. We had two
8 exhibit issues that arose on the redaction -- redaction
9 issues. I just simply said in chambers, please meet and
10 confer and try to let us know by 5:00 o'clock. I think
11 that should be worked out by the parties.

12 If the Plaintiff sees the Defendant's
13 redactions and you feel they've gone too far, let us
14 know. But I would hope the parties can agree upon that.
15 If not, try not to give me a thousand pages of exhibits
16 to look at. Let's try to at least narrow the issues
17 involved.

18 The other issue is, Mr. Dawson, you have
19 offered additional exhibits that were not listed on the
20 pretrial order, and it's my understanding, basically,
21 this goes to the loss-of-profit issue; is that correct?

22 MR. DAWSON: Yes, Your Honor. I don't
23 want to speak for Mr. Wilson, but I think when we're
24 conferring on the redaction, we may be able to reach
25 agreement on a limited use of those documents.

1 And so with his permission, I'd ask the
2 Court to defer that until --

3 THE COURT: Is that correct, Mr. Wilson?

4 MR. WILSON: That's correct, Your Honor.

5 THE COURT: Also, in the same timeframe,
6 let me know where you are on those exhibits and if any
7 issues remain concerning those.

8 MR. DAWSON: One.

9 MR. HARDIN: Your Honor -- I'm sorry.

10 MR. DAWSON: We have notified RTI that
11 we're withdrawing a couple of our defenses. How would
12 you like us to notify the Court of that?

13 THE COURT: You can tell me right now, if
14 you want to.

15 MR. DAWSON: If I knew what they were, I
16 would, but we will note -- we will take it up --

17 THE COURT: Let us know Monday morning.

18 MR. DAWSON: Monday morning, we'll tell
19 you. We've withdrawn a few defenses.

20 MR. HARDIN: Your Honor, I think I spoke
21 too broadly, because I thought we had a withdrawal of
22 some validity defenses when I said we're dropping the
23 Doctrine of Equivalents, because those are interrelated
24 concepts.

25 I have to say I'm not going to urge the

1 Doctrine of Equivalents on every claim, but, for
2 example, breaking and cutting, we may have to -- so I
3 want to --

4 THE COURT: Do you know which claims you
5 might be dropping that as to?

6 MR. HARDIN: I can -- I will inform the
7 Court on Monday, but I need some -- I thought we had a
8 withdrawal of some invalidity defenses, and we didn't
9 have that.

10 So with the Court's permission, I'd
11 like to -- we will certainly give the Court notice
12 before --

13 THE COURT: Withdraw it as to certain
14 claims but probably not all claims.

15 MR. HARDIN: That's correct, Your Honor.

16 THE COURT: Fair enough.

17 Any other matters?

18 Everyone have a pleasant weekend. I'm
19 confident that a lot of work will be done over the
20 weekend.

21 We'll be in recess.

22 COURT SECURITY OFFICER: All rise.

23 (Court adjourned.)
